**For Immediate Release**

## **Phoenix Rises to Bring Solutions**

Surprise, Arizona, July 26, 2010 – Seccua Americas LLC, the Americas sales and support arm of Seccua GmbH, the global leader in the field of high technology driven ultrafiltration water treatment systems that remove pathogens from drinking water. The company's mission is to bring safe drinking water to those with challenging water conditions.

Targeting the non-community, small community, transient and non-transient water systems that are required to meet state regulatory requirements, Seccua Americas has unveiled **Phoenix**, a scalable system that delivers 15,000 to 130,000 GPD (57 to 492 m<sup>3</sup>day) of pure drinking water and can be run in parallel to produce enough water to meet the needs of a community. **The Phoenix systems include fully Automatic Membrane Integrity Testing**, a state-of-the-art feature which is not available as a standard feature on other small treatment systems. Phoenix continually monitors the actual degree of fouling on the membrane based on flow and differential pressure and automatically reacts to changing feed water conditions to minimize water usage. An advanced remote monitoring and alert system can send an SMS text message to alert up to ten people of changing system status, and integrated data-logging maintains a record of operating history. With the optional internal high speed modem remote access and programming allows the user to adjust operating parameters or review information from the data-logger. The Phoenix system removes pathogens from the water supply without adding chemicals, making it a green technology which provides safe, crystal-clear potable water without the formation of possible harmful chemical byproducts.

Seccua is the global technology leader in standardized ultrafiltration systems for the residential and small community markets as well as for applications involving the re-use of wastewater. The Company's Virex Pro and Phoenix lines of ultrafiltration systems incorporate industry leading smart SCADA controllers that automatically control all operational needs: Fully automatic membrane backwash, automatic integrity testing, remote access and control, as well as data logging are all standard features of Seccua's advanced systems. There are over 700 installations of the company's systems in use worldwide designed and built by highly skilled engineers and technicians in Seccua's ISO 9001:2008 certified manufacturing and R&D facilities located in Bavaria, Germany.
